I was isolated from a human umbilical vein emotherlial cell cDNA library. The coding sequence can be incorporated into a vector and used for prodn. of recombinant TNF-gamma using bacterial, insect or mammalian cells as hosts. It may also be used as a diagnostic probe for gene mapping, or for the gene therapy of diseases involving abnormal cellular proliferation, e.g. tumours and cancer. Antisense sequences are useful as TNF-gamma antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         against infection

The protein has high biological activity, including enhancing cytotoxicity of killer cells and inducing killer cell formation, in addition to inducing IFN-gamma production by immunocompetent cells when expressed in mammalian cells, facilitating its use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            treatments, minimising side effects. can be used in gene therapy, e.g. by the DNA or transplanting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mat_peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents a fragment of the human thymopoletin gene, including exons 4 and 5. DNA encoding human thymopoletin, from a cDNA library prepared from human thymus RNA, may be expressed in a host cell e.g. bacterium (preferably Escherichia coll), fungus, insect or mammalian cell for production of recombinant thymopoletin has a regulatory effect on the mammalian immune system, and can be used for treating/modulating an immune or nervous system condition, and for the treatment of chronic infection, autoimmune disorders and certain affective psychiatric or neurological disorders. The protein and the DNA can be used as diagnostics; the DNA can be used in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      And Least One nucleic acts includes which injurialisation as a determination of possible presence of testicular seminoma, non-small cell lung carcinoma melanoma, breast cancer, sarcoma, or leukaemia in the sample. By assaying for the MAGE-B1 gene, or MAGE-B2 gene, both contained within this 40352 base pair MAGE-B cluster DNA sequence, the presence of such cancers in a sample can be determined. The genomic DNA that encodes the MAGE-B2 gene consists of nucleotides 3266-7979 of this MAGE-B cluster DNA sequence. The nucleic acid molecule that encodes a MAGE-B1 gene, consists of, in 5' to 3' order, nucleotides 31403-31474, 33958-34062, 35057-35139, and 38088-39691, nucleotides 31403-31474, 33958-34062, and 38088-39691, cucleotides 31403-31474, 33958-34062, and 38088-39691, order, between the primers specific for the MAGE-B consists of this sequence. The primers specific for the MAGE-B consists of this sequence. The primers specific for the MAGE-B consists of this sequence. The primers specific for the MAGE-B consists of this sequence. The primers specific for the MAGE-B consists of the sequence and the mage-B gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match 8.8%;

The invention provides a nove method for screening for the possibility of a testicular seminoma, non-small cell lung carcinoma, melanoma, breast cancer, sarcoma, or leukaemia in a sample. The method comprises contacting the sample with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              05-JUN-1996; US-658578.

Example 1; Page 274-279; 329pp; English.

A DNA sequence (T61677) codes for human GDP-Fuc:beta-D-
galactoside alpha(1,2)-fucosyltransferase (W13640), an enzyme
involved in the expression of type I and II blood group H
structures. It was obtd. by transfecting mouse L cells with DNA
derived from human A431 cells, and selection of transfectants the
expressed the H antigen by using anti-H antibody in a panning
procedure. The DNA can be used to construct animal cell lines
with specific capabilities with respect to post-translational
modification of the oligosaccharides of expressed proteins or
                                                                                                                                                                                                                                           22-AUG-1991;

            e.g. the presence of soluble or membrane bound oligo or polysaccharide or glycosyltransferase. pisclosure; Fig 3; 155pp; English.

The DNA encodes a protein sequence capable of functioning as a gdp- ruc:[beta-p-Gal alpha(1,2)- fucosyltransferase. The sequence coded by nucleotides 4782 - 5780 represents the functional protein the enzyme produced by the DNA sequence can be used in enzymatic fucosylation of chain-terminating galactose residues on lactose-
                                                                                                                                                                                                                                                                                                                                                                                                                  07-NOV-1991 (first entry) GDP-Fuc:beta-D-galactoside alpha(1,2)-fucosyltransferase Glycosyltransferase.

                                                                                                                                                                                                                                                                    DNA fragment encoding a glycosyltransferase - can be used for in vitro reactions to modify cell surface oligosaccharide(s) e.g. blood gp. determinants to protect against transplant rejection pisclosure; Fig 3; 249pp; English.

The sequence is that encoding human glycosyl transferase. The enzyme produced by the DNA may be non glycosylated. This prevents premature loss of enzyme activity. It can also be used in in vitro reactions to modify cell surface oligosaccharide mols. e.g. blood group determinants. See also 056905-12.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC isolated from a bacterial artificial chromosome (BAC) library covering Ct the complete human genome. Clone BAC 123H04M was isolated using STS C probes and markers based on human chromosome 1 (the gene's location CC was confirmed as being in the region 1q23-q25 by fluorescence in situ hybridisation). The BAC clone was digested with restriction enzymes. The fragments were subcloned and the inserts sequenced. The human FMO Sequence was identified by homology to known FMO sequences. Fragments CC of the FMO2 sequence can be used as primers or probes specific for CC particular alleles, especially the G.125 anac. A mutation. Detection of this mutation allows diagnosis of a predisposition to FMO-associated CC diseases, particularly juvenile wide-angle primary glaucoma (WAPG), CC but more generally any condition involving altered response to cxidative stress, including toxic and degenerative disorders, coidative stress, including toxic and degenerative disorders are excessive or inadequate CC degeneration. Other FMO-related disorders are excessive or inadequate CC degeneration of drugs, toxic xenobiotics or carcinogens. The process and cells expressing them can also be used for the biosynthesis/biodegradation, particularly detoxification, of xenobiotics of pharmaceuticals, food additives, pesticides and herbicides. The present sequence is the human polycystic kidney disease 1 (PKD1) gene. The PKD1 gene or polypeptide may be used to treat autosomal dominant polycystic kidney disease (APKD), and identify carriers of mutant PKD1 genes, i.e. subjects susceptible to APKD. Antibodies (Ab) that distinguish between normal and mutant PKD1 sequences can also be used in diagnostic tests. Anti-PKD1 Ab may also be used to perform subcellular and histochemical localisation studies, and to block the function of PKD1. Ab are also useful in rational drug design studies to identify and test inhibitors of

The present sequence is the human polycystic kidney disease 1 (PKDI) locus between chromosomal markers ATPL (ATPBC) and D16884.

The PKDI gene or polypeptide may be used to treat autosomal disease (AFKD), and identify carriers of mutant PKDI genes, i.e. subjects susceptible to APKD. Antibodies (Ab) that distinguish between normal and mutant PKDI sequences can also be used in diagnostic tests. Anti-PKDI amay also be used to perform subcellular and histochemical localisation studies, and to block the function of PKDI. Ab are also useful in rational drug design studies to identify and test inhibitors of PKDI. Sense and antisense sequences derived from the PKDI gene may used for detection and therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Сþ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The present sequence is that of the normal human PKD1 gene from CC chromosome 16. Mutations in this gene (e.g. transitions, cc transversions, deletions and/or insertions) are associated with CC adult-conset polycystic kidney disease (APKD). The PKD1 locus is CC reported partial cDNA sequence revealed differences at three CC locations (see features table). The most significant difference is CC the presence of two additional cytosine residues on the plus-strand CC at position 4566 of the previously reported sequence. The insertion CC results in a frame-shift in the predicted protein coding sequence, CC leading to replacement of 92 C-terminal amino acids with a novel CC 12 amino acid C-terminus. The PKD1 gene contains 23 Alu repeats. CC There is a region consisting of 17 tandem copies of a perfect 27 bp CC repeat and two large CT-rich regions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PT New polynucleotide(s) encoding secreted human proteins - are derived PT from, e.g. human foetal brain or foetal kidney cDNA libraries, PT potentially useful as, e.g. vaccines or thrombolytic agents Claim 1; Page 67-68; 120pp; English.

CC contain 1; Page 67-89; 120pp; English.

CC secreted protein (see W74720). It was isolated from a human foetal brain cDNA library using methods which are selective for cDNAs Contain cDNA; Library using methods which are selective for cDNAs Contain cDNA; Library using methods which are selective for cDNAs contain contain secreted proteins, or was identified as encoding a secreted or transmembrane protein on the basis of computer analysis of the amino acid sequence of the encoded protein. It shows some celement. The invention provides polynucleotides (see V62746-55) contain a claim train, adult testis, adult brain, adult kidney and foetal brain, adult testis, adult brain, adult kidney and foetal kidney (all deposited as composite clone ATCC 98404), which can contain a secreted proteins (see W74720-29). The polynucleotides and proteins are predicted to have blological activities which would conditions in humans and animals, although no supporting data are conditions in humans and animals, although no supporting data are conditions in humans and animals, although no supporting data are conditions in humans and animals, although no supporting data are conditions in humans and animals, although no supporting data are conditions and thrombolytic activity, tissue growth activity, hammune cativity, chemotactic/chemokinetic activity, catherin/tumour invasion suppressor activity, and tumour inhibition activity, The polynucleotides are cativity, and tumour inhibition activity, and can be used in recombinant production of the polypeptidess.

PS Claim 1; Fig 9; 209pp; English.

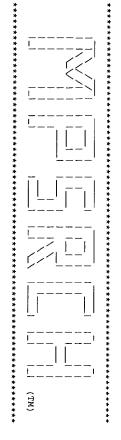

CC The present invention describes hereditary haemochromatosis gene. The present sequence converges of the present of the present of the common hereditary converges of the common hereditary converges of the presence or absence of the individual comprising:

CC (a) providing DNA or RNA from the individual; and (b) assessing the color of the presence or absence of absence of a haplotype or genotype where converges of the HFE gene mutation in the genome of the individual. The common sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present convertion also describes BTF genes, which are homologues of the milk convertion also describes BTF genes, which are homologues of the milk convertion and sequences from the products for the production of agonists converted by the convertion and sequences of the milk convertion and sequences of a type 1 sodium transport gene, and can be used for hypophosphatemia.

The novel proteins have LCAT-like activity. The proteins and agonists can be used for treating or preventing e.g. arteriosclerosis, atherosclerosis, hyperilipidemia, atherosclerosis hypercalorism, obesity, hypertriglyceridemia, inflammatory diseases, senescence, diseases of the brain, or renal disorder. Inhibitors of the protein can be used for treating or preventing e.g. malnutrition, the protein can be used for treating or preventing e.g. malnutrition.

Database:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 11.877; Variance 6.071; scale 1.957

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             source
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            repeat_region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    variations annotated may not be found in the sequence submission corresponding to the overlapping clone as we submit sequences with only a small overlap as described above. This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre chromosome X mapping group. Further information can be found at http://www.sanger.ac.uk/HGP/Chx/
This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The true left end of clone 196E23 is at 1 in this sequence. The true right end of clone 196E23 is at 123004.

196E23 is from the library RPCII constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong.
